Key Features and Benefits

Gold-plated Connector Head – ***Delivers better quality output***
Gold-plating protects the connector from corrosion so the connector lasts longer and also reduces contact resistance.

Polymer Spine – ***Reduces cable kinking***
The cable contains a polymer spine which reduces concerns of cable kinking while installed. Cable kinking affects data transfer and can cause cable failure.

Double-Molded Connector Housing – ***Protects against hard knocks***
Strong and hard connector housing protects the cable connection from repeated hard knocks and high shocks for a long time. Inner molding keeps the connectors firmly in place to prevent loosening or disengagement on points where cable wirings are soldered to the connector.

High Density Sleeving – ***Protects against wear & tear***
Protects the cable. Strong, thick, dense sleeving is not just for looks, also serves a practical purpose of protecting your cable from wear and tear.

Turtle Neck – ***Reduces cable connector failures***
The turtle neck defeats over flexing at the cable-connector interface, the common site for cable failure.

Snag Free Boot – ***Protects the connector lever arm***
The Hypertec cable incorporates a novel connector boot that protects the jack release lever arm from snaging when installed whilst allowing simple tool free extraction of connector jack from a socket.
